

Attention Septic Tank Owners

How you can save money
by keeping your septic system
effective and healthy

septi-cure[®]

Your septic tank is a delicately balanced environment. It doesn't take much to upset the system.

Problems: When your system is not working properly you notice nasty odours, leach lines block, untreated liquid rises to the surface, toilets gurggle and take time to empty.

Health Hazard: At this stage your septic tank system is a serious health hazard to you and your children. Human waste produces faecal coliform bacteria which is a source of viral and bacterial gastroenteritis as well as Hepatitis A and other diseases. Hepatitis can be a debilitating condition and cause long-term harm to children.

Remedies: There are only three remedies. One, stop using the system until it recovers. This may take over a month and is not normally practical. Two, excavate your septic tank system and relocate at a cost of several thousand dollars plus considerable inconvenience. Three, give your system Septi-Cure™ every six months.

By far the most cost effective solution...

... is to pour 1 litre of Septi-Cure™ down each toilet bowl every six months. This simple action will keep your system working at top efficiency by reducing solids and scum. Instead of emptying your tank frequently, the reduction in solids and scum saves you expensive pump out costs. Your irrigation field and leach lines will be clear of slimes and blockages so nature will handle the gradual seepage and evaporation for you. When this is happening your system will be operating effectively and not endangering you or your family's health.

How does Septi-Cure Work?

Septi-Cure™ is a concentrated mixture of selected naturally occurring micro-organisms. These harmless tiny organisms live and multiply by feeding on waste material. When they are introduced to your septic tank system, they go to work straight away digesting the waste material, reducing solids and scums. This means that your system will start to operate to its maximum efficiency. As they progress through to your irrigation field they feed on the slimes that prevent seepage and evaporation. When seepage and evaporation return to normal, you have reduced the risk of contaminating groundwater and the environment as well as reducing the chances of infection for you and your family. Eventually, they get washed out of the system and have to be replaced to continue their work. That is why you introduce Septi-Cure™ to your system every six months for maximum efficiency.

Testimonials

"Thank you for advising us to use Septi-Cure™. Our service person is amazed how well it works, leaving our tank in such a good condition. We have been using Septi-Cure™ for three years which allows us to have a low maintenance, odour free septic tank. Thank goodness we have a professional supplier like Ecoworld to look after our requirements."
